

Stress and Coping Strategies Among Rural Clergy: A Quantitative Survey

Following the recent amalgamation of numerous rural benefices in the Church of England, many rural clergy are experiencing high levels of stress caused by time-related overextension and inadequate resources. In order to survive, these clergy need to be able to manage the personal and / or environmental stressors that they encounter. Throughout the book, the factors surrounding the work-related psychological health of rural clergy have been researched through the review of relevant literature and, where appropriate, the psychometric properties of the measurement instruments being employed have been evaluated through the assessment of internal reliabilities.
